

Toolless Double Edge Splice Tape w/Pins

Silver & Blue for Metal Detecting and No Splice Detection Feeders

Toolless Silver and Blue Double Edge Splice Tapes can be used with all metal sensing smart feeders, and any feeders without splice detection. They can be used on paper or plastic tape, punched or formed pockets, and any cover tape. They are primarily used for splicing on-the-fly without removing a tape feeder from the pick and place machine. With an on-board pin jig alignment system, they can be used without any additional alignment jigs or splice tools in under 10 seconds for an 8mm splice. After alignment, the tab with the pin jigs is removed for final splicing. These splice tapes are available in 8-72mm widths, and wider on request.

Black for Emitter/Receiver Detecting Smart Feeders

Toolless Black Double Edge Splice Tapes can be used with all emitter/receiver sensing smart feeders. They can be used on paper or plastic tape, punched or formed pockets, and any cover tape. They are primarily used for splicing on-the-fly without removing a tape feeder from the pick and place machine. With an on-board pin jig alignment system, they can be used without any additional alignment jigs or splice tools in under 10 seconds for an 8mm splice. After alignment, the tab with the pin jigs is removed for final splicing. These splice tapes are available in 8-72mm widths, and wider on request.
